

e-Invoice

e-Invoice Service System is a secure platform integrating the systems of issuers and recipients of e-invoices and implementing full range of services allowing for common use of e-invoices.

The system supports e-invoice throughout its cycle of existence in business transactions.

e-Invoice System modules:

- **signature module** – allowing for qualified e-signature in order to ensure authentication of origin of e-invoices and integrity of their content
- **distribution module** – allowing for delivery of issued e-invoices to recipients and obtaining delivery reports
- **e-Invoice archive** – allowing for secure storage (in encrypted form) of issuer's and recipient's e-invoices. The archive also ensures full and continuous electronic access to stored e-invoices, allows for documenting their access and ensures e-document evidence value conservation
